SU JIN LEE

AI Automation Engineer | Generative AI Systems

Seoul, South Korea | su.jin.lee.developer@gmail.com
Portfolio & Demo / LinkedIn / GitHub: jindeveloper-ai

PROFILE

Builds Python-based AI automation systems with parallel execution, checkpoint recovery, artifact validation and remote processing. Integrates generative AI and media tools into repeatable workflows with explicit execution state and verifiable outputs.

TECHNICAL SKILLS

Code & automation Python, Bash, JSON, checkpoints, parallel processing

AI & media Replicate, Qwen VL, MediaPipe, FFmpeg / FFprobe, Blender

Operations Ubuntu, Git, GitHub Actions, unittest, prek

EXPERIENCE

Mel Feb 2026 - Present | Remote

AI Content Creator & Automation Designer

- Developed a **Python executor with parallel processing and stage checkpoints** to reuse valid completed outputs and retry failed items or stages.
- Integrated generative AI services with **Blender, FFmpeg and Ubuntu remote processing**, validating job manifests, expected outputs, code revisions and file hashes.
- Implemented **13-criterion quality gates** requiring at least 4/5 per criterion and rejecting critical defects. Bound review evidence to SHA-256 file hashes to block stale or mismatched approvals.
- Built a **10-stage content workflow** spanning reference research, image and video generation, post-production, validation and delivery, with explicit inputs and completion criteria.
- Established **unit tests, GitHub Actions checks and operating documentation**. Published records include 26 passing non-production tests and 30 matching synthetic collection records.

Authored the current automation configuration, code and documentation beyond the supplied original skill. Validation: Sep 3, 2026 public record; these are test results, not production time or cost savings.

SELECTED PROJECT

Video Attention Analysis | Independent Applied Research

- Implemented a DeepGaze IIE workflow to generate heatmaps, comparison video and review segments from 66 sampled frames of a 22.13-second video.
- Compared temporal information enabled versus bypassed across 18 UNISAL runs; evaluated execution and output differences, not measured gaze or preference accuracy.

EDUCATION

University of the People Planned start: Nov 2026

Computer Science | Admitted

Shin-gu University College 2024 - Present

Visual Communication Design | Currently on leave of absence
